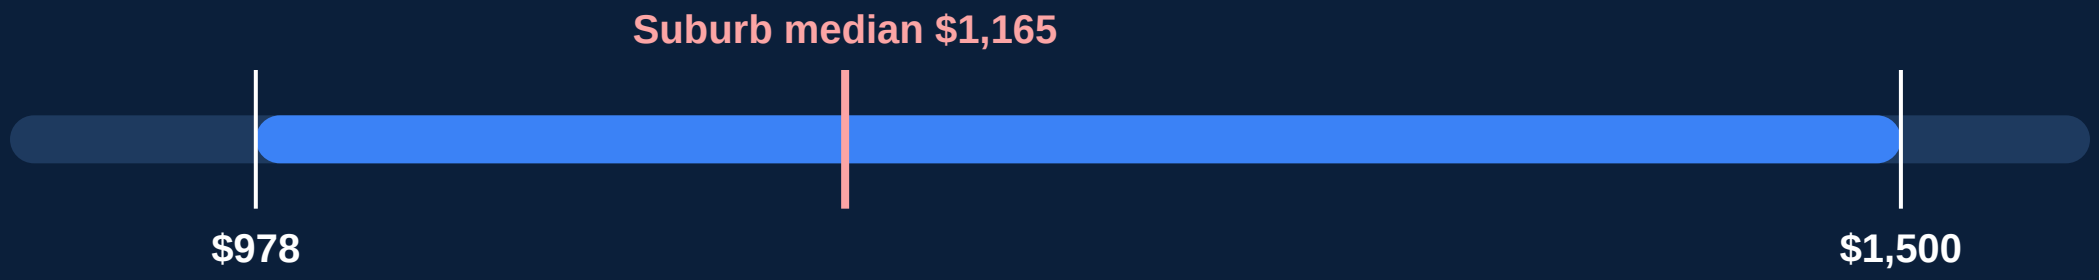
UNI TRIFECTA

What should a 2-bedroom flat with parking in Zetland rent for?



Typical weekly ask, building by building

WHAT WE FOUND

The building sets the rent. Not the suburb, not the floor.

$522

a week between the cheapest and dearest Zetland building, same flat type

$1.46

a week per extra floor, once you know the building

$76

a week for a car space, typically

$100

a week: how far a suburb average typically misses a flat's asking rent

HOW IT WORKS

Start with the closest evidence. Widen only when it runs out.

This flat's own past rents

count most when it advertised before

Same building

same bedrooms, bathrooms and parking

Nearest buildings

within 1 km, closer ones count more

Suburb

only if nothing is close

- 65,777 flats, each with two weekly rents: with a car space and without.
- Older adverts are brought up to July 2026 prices, and newer ones count more.
- Nothing dated after 31 July 2026 is used.

DOES IT WORK?

Tested only on adverts the model had not seen.

Typical (median) miss, dollars a week. Lower is better.

3 in 4

estimates land within $100 (74% rolling, 77% May to July; suburb method 57%)

Same setup

learn from adverts up to a month's end, then score the next two months, just like the real test

LIVE DEMO

Is my rent fair? Ask in 20 seconds.

1

Type your address

e.g. 841/2C Defries Avenue, Zetland

2

Check the details

bedrooms and parking fill in from the records

3

Enter your rent

see how it compares with similar flats

The range tightens when we know more: about 7% wide for a flat with its own advert history.

microburbsdataanalysis.vercel.app

WHAT'S NEXT

Building by building, not suburb by suburb.

Where it's weaker

- Buildings that have never advertised: no evidence of their own.
- Renovated or furnished flats asking well above their building (about 1 ask in 8).

What we'd add

- Microburbs data such as transport, schools and new development for buildings with no adverts.
- Monthly refresh, so every check uses the latest adverts.

Thanks! microburbsdataanalysis.vercel.app

BACKUP FOR QUESTIONS

The technical details, if asked.

- Estimate: weighted median of past asking rents. Older asks are brought forward with a citywide quarterly index and count half as much every 3 years.
- Order of evidence: own past asks (75% weight) > building (same bedrooms, parking; bathrooms if 3+ adverts) > 10 nearest buildings within 1 km (weight halves every 500 m) > suburb > bedrooms.
- Thin buildings are pulled toward their neighbours. Each parking side is adjusted by its own evidence.
- Missing parking side: other rent plus or minus the local car-space gap, capped at 25% of rent.
- Testing: settings chosen on rolling tests before May 2026. May to July was looked at across versions, so the rolling $51 is the fairer guide.
- Hard cases (rolling tests): no own history $63 typical miss; no usable building history $90.
- Tried and dropped: floor adjustment, forcing parking above no parking, a growth lift after 31 July.
